

# Module 2 Credit Task

## Credit Task: Module 2 Above and Beyond Task

### Overview of the task

You need to demonstrate and provide evidence of going above and beyond in this module.

### Submission Details

- For a Credit you must complete all the above and beyond tasks in this unit and submit them together at the end of the unit.

### Module 2: Above and Beyond Task

For this module, the above and beyond task is create a prototype of a forest fire monitoring and alarm system. You must implement this using Node.js, MQTT, and Node-RED. You can base this on the week 4 technical task.

The requirements are as follows:

- You must have multiple sensors - at least 4 - detecting heat, smoke and fire in a forest.
- You will need to alert different groups of people, i) local home owners, ii) the fire service, iii) new organisations, iv) notifications on social media services.
- You should alert based on some rules for the amount of heat, smoke and fire. A single sensor should not cause an alert

You can use single board computers such as Arduinos, Raspberry Pis, etc as well as off-the-shelf devices such as mobile phones, tablets or even your laptops. You also have the option to simulate devices (e.g.: instead of a physical device sensing the environment, you can use a script to generate random values).
